REPORT NOTICE

This report contains AI-generated text and analytical commentary. AI outputs may contain inaccuracies, fabricated references, or unintended bias. Content is provided for research and informational purposes only and should be independently verified before reliance.

AI-GENERATED SECTIONS

This report combines deterministic statistical analysis with narrative text generated by large language models (LLMs). The table below discloses every AI-generated section included in this report and the model that produced it. AI outputs may contain inaccuracies, fabricated references, or unintended bias and should be independently verified before reliance. All other sections are computed deterministically from the analyzed corpus.

1. CORPUS OVERVIEW

Composition and size of the corpus in the current scope: document types, chunk length statistics and coverage of the project's coding parameters. Generated October 4, 2026 10:49.

1.1. Document Composition

Table 1. Document composition by type in the current scope.

DOCUMENTS BY TYPE	DOCUMENTS
Article Import	500
Total	500

1.2. Chunk Length (Words)

Table 2. Chunk length statistics in words for the current scope.

CHUNKS	TOTAL WORDS	MEAN	MEDIAN	MIN	MAX
761	734,447	965.1	1140.0	38	1,481

Word counts are whitespace-based estimates (space count + 1) computed on chunk contents.

1.3. Parameter Coverage — Model

Table 3. Parameter coverage — Model: chunks per value in the current scope.

MODEL	CHUNKS
GPT 5.5	200
Gemini 3.1 Pro preview	156
DeepSeek V4 Pro	154
Grok 4.3	151
Claude Opus 4.7	100

Top 5 values by chunk count within the current scope.

2. FEATURES

2.1. Topic Modeling (LDA)

Discover hidden topics using Latent Dirichlet Allocation (LDA).

2.1.1. METHOD & IMPLEMENTATION

Latent Dirichlet Allocation (LDA) with coherence-based topic count selection

1. The curated corpus is converted into a Gensim dictionary and bag-of-words document-term matrix.
2. LDA (Gensim LdaModel, seeded) infers K topics as word-probability distributions plus soft document-topic assignments; K defaults to 10 and, with auto-optimization on, is swept from 3 to 15.
3. The winning K maximizes C_v coherence; final quality also reports U_Mass coherence (Röder et al. 2015) and the model's log-perplexity bound.
4. For corpora of at least 100 documents, seeded retrains (2 extra seeds by default) produce a topic-stability score in [0, 1] so unstable topics are visible before you interpret them.
5. When Gensim is unavailable, scikit-learn's LatentDirichletAllocation takes over as the fallback engine.

LIBRARIES: Gensim 4.4.0 — LdaModel + CoherenceModel scikit-learn 1.9.0 — LatentDirichletAllocation (fallback)
NumPy 2.5.2 — matrix math

Latent Dirichlet Allocation (Blei et al. 2003) with the topic count selected by C_v coherence; final quality also reports C_NPMI and U_Mass coherence (Roder et al. 2015).

2.1.2. Visualization

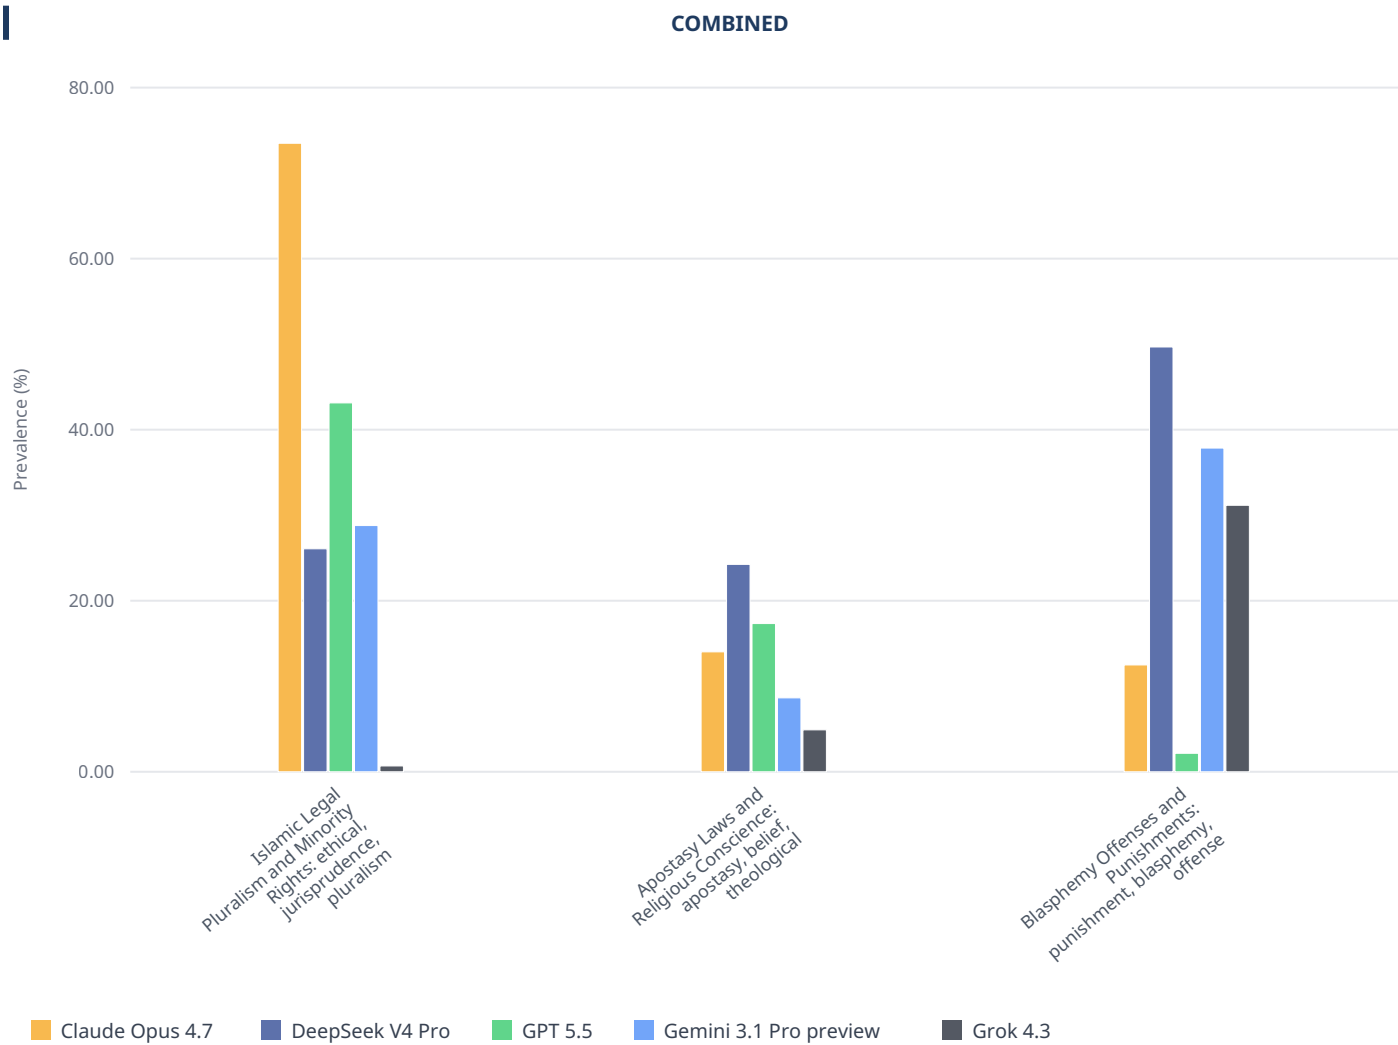

Figure 1. Topic Modeling (LDA) — combined visualization across compared Model values.

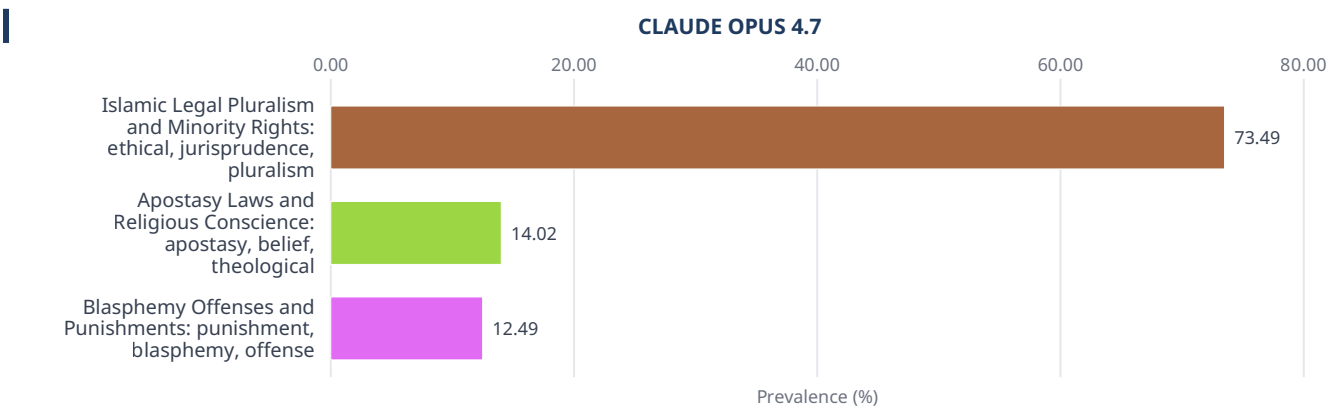

Figure 2. Topic Modeling (LDA) — visualization for Model "Claude Opus 4.7".

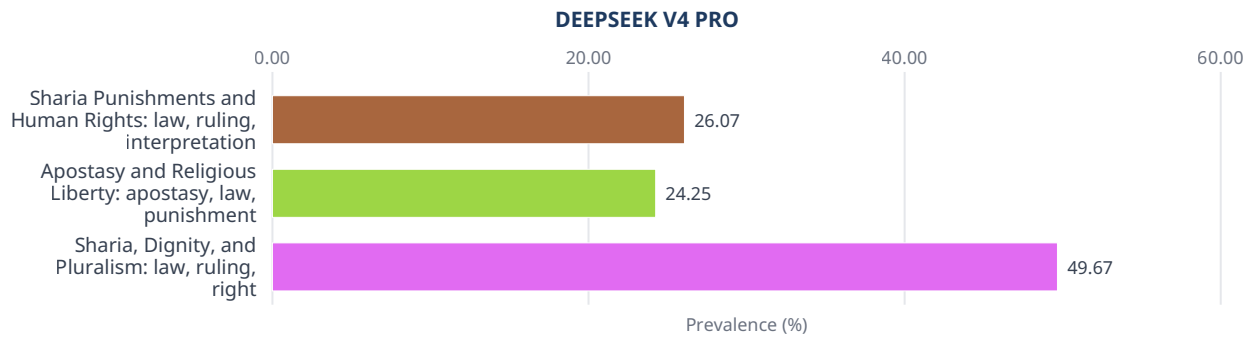

Figure 3. Topic Modeling (LDA) — visualization for Model "DeepSeek V4 Pro".

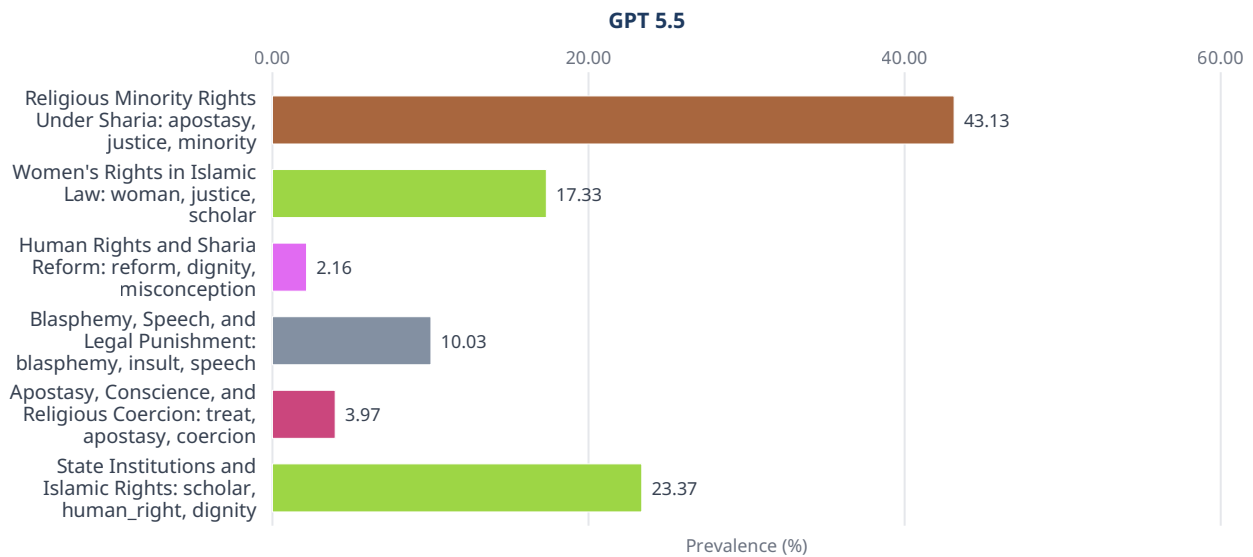

Figure 4. Topic Modeling (LDA) — visualization for Model "GPT 5.5".

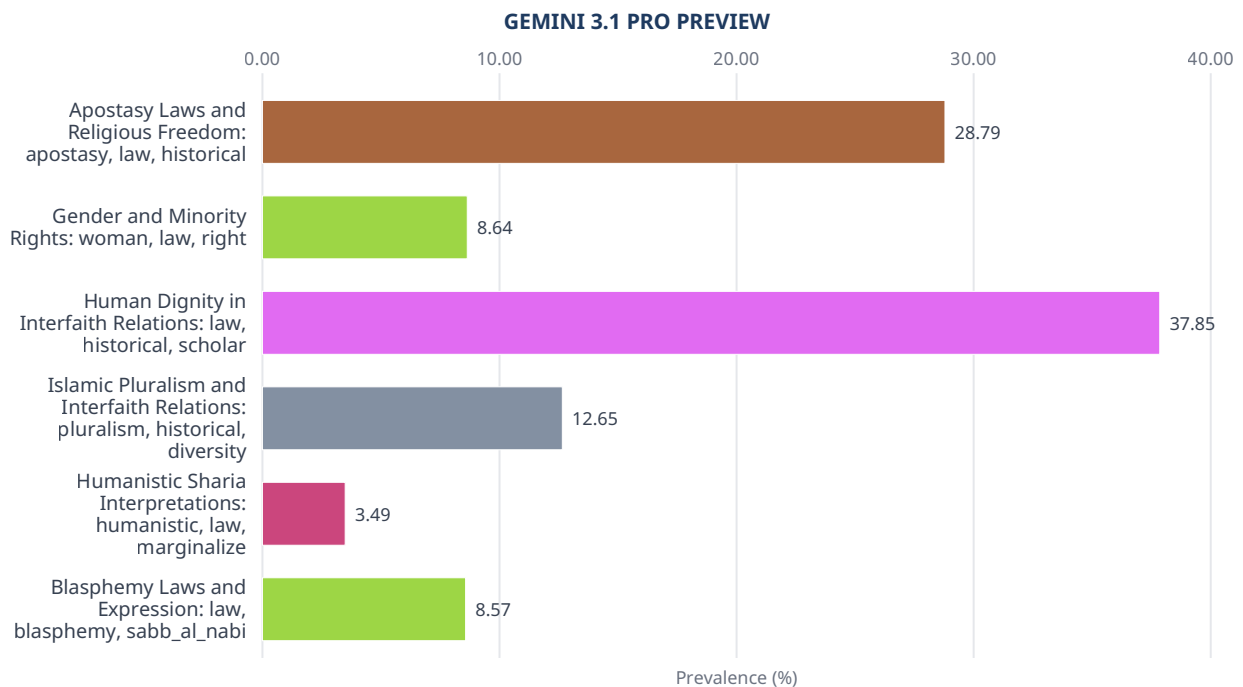

Figure 5. Topic Modeling (LDA) — visualization for Model "Gemini 3.1 Pro preview".

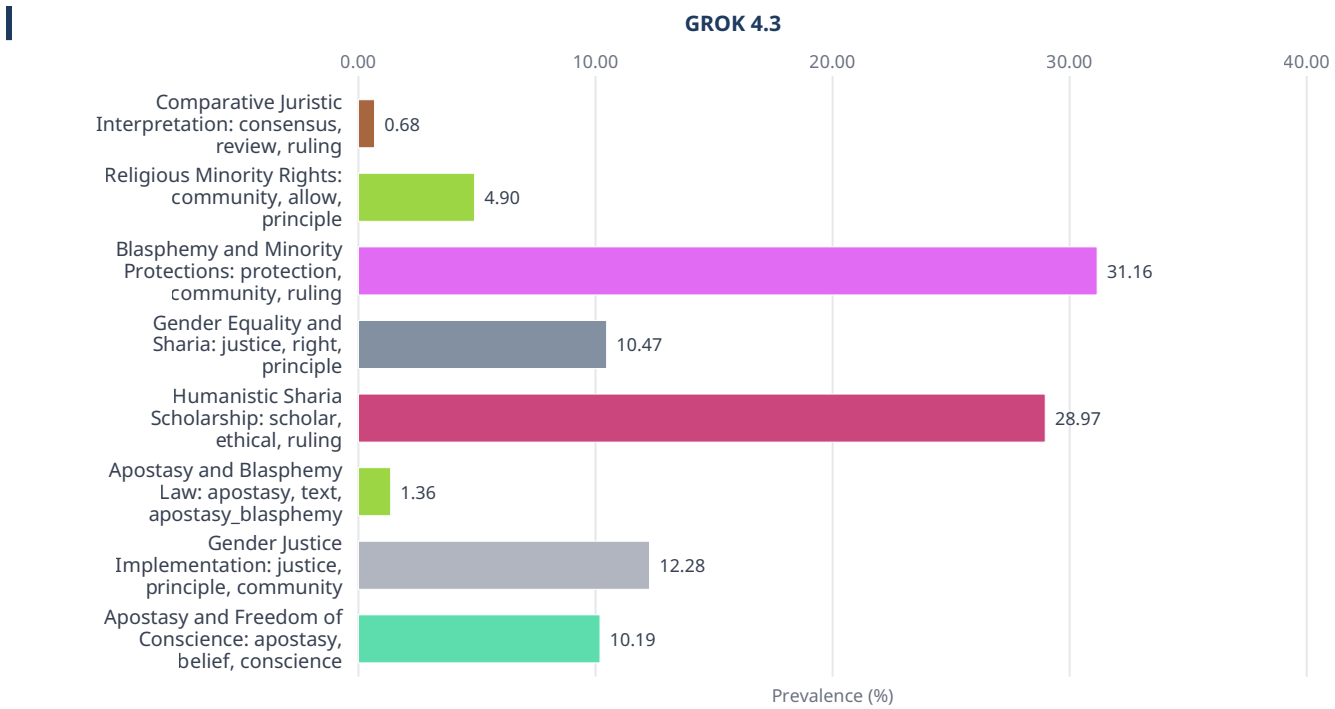

Figure 6. Topic Modeling (LDA) — visualization for Model "Grok 4.3".

2.1.3. Signal Dataset

CLAUDE OPUS 4.7

2.1.4. Topic Coherence

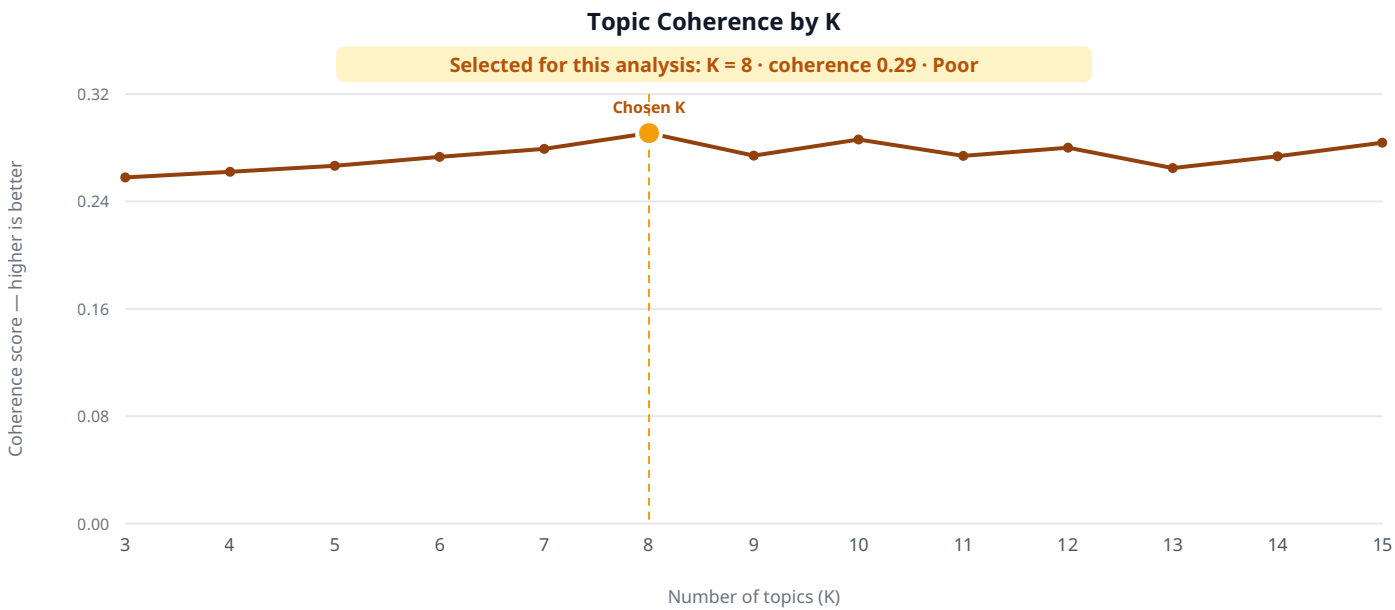

Figure 7. Topic coherence (c_v) across candidate topic counts K from the K search.

Table 9. Coherence (c_v) scores across candidate topic counts K; the chosen K is highlighted.

K	COHERENCE (C_V)	MEANING
3	0.2550	Poor
4	0.2591	Poor
5	0.2635	Poor
6	0.2701	Poor
7	0.2760	Poor
8 SELECTED	0.2876	Poor

K	COHERENCE (C_V)	MEANING
9	0.2710	Poor
10	0.2829	Poor
11	0.2708	Poor
12	0.2769	Poor
13	0.2619	Poor
14	0.2705	Poor
15	0.2806	Poor

Held-out perplexity: 730.84 (lower is better). Topic stability: 0.55 (2 extra seeds).

How to read this chart: each point is one candidate topic count (K); higher coherence means better-separated topics. The highlighted K is the one the analysis selected — chosen automatically, favouring the smallest topic count whose coherence stays close to the best score; differences under ~0.02 are noise.

2.2. Word Frequency Analysis

Analyze the frequency of words in the text to identify the most common terms.

2.2.1. METHOD & IMPLEMENTATION

Term frequency counting + log-likelihood keyness (G^2)

1. Preprocessed tokens (lowercased, stopwords and punctuation removed) are collected per chunk; absolute occurrence counts are aggregated with Python's `collections.Counter` and ranked to surface the dominant vocabulary.
2. Top lists are capped by the configured limits (default: 100 terms globally, 10 per chunk) so output stays readable on large corpora.
3. In segmented runs, each group is compared against the rest of the corpus with log-likelihood keyness G^2 (Dunning 1993); p-values come from the chi-square survival function and log-ratio effect sizes quantify how much more (or less) each group uses a term.
4. Because G^2 is symmetric, both statistically over- and under-represented terms are flagged per group — characteristic absences become visible, not just characteristic overuse.

LIBRARIES: Python 3.12 — `stdlib collections.Counter` for counting SciPy 1.18.1 — chi-square significance for G^2 keyness

Raw token counts after stopword removal; per-group keyness uses the log-likelihood ratio G^2 (Dunning 1993).

2.2.2. Visualization

2.3. Sentiment Analysis

Analyze the emotional tone and sentiment polarity of the text.

2.3.1. METHOD & IMPLEMENTATION

VADER sentence-level compound scoring (English) / polarity lexicon with negation handling

1. English corpora are scored with NLTK's VADER SentimentIntensityAnalyzer, which combines lexicon polarity with intensity, punctuation, capitalization, and degree-modifier rules into a compound score from -1 to +1.
2. Because VADER's compound saturates toward -1/+1 when scored over one long chunk, English chunks are segmented into sentences, each sentence is scored individually, and the sentence compounds are averaged per chunk — the documented adaptation of VADER to non-short text.
3. Other languages use polarity lexicon matching: a sentiment term whose 3 preceding tokens contain a negator has its valence flipped, catching constructs like "not good".
4. Each chunk is labelled positive (score ≥ 0.05), neutral, or negative (score ≤ -0.05); per-chunk scores, averages, and label distributions are then aggregated.
5. Every chunk also persists term-level evidence — the sentiment-bearing terms with their mean valence and occurrence count, plus which terms a negator flipped. The signal dataset highlights these words in green (positive) or red (negative), each label carries a reason naming the strongest drivers, and the summary ranks the corpus-wide top drivers.
6. Validation status: VADER is a published, externally validated instrument; the lexicon path is regression-tested against an internal Indonesian gold set (label accuracy must stay $\geq 80\%$). Lexicon runs also report per-run coverage — average matched terms per chunk and the share of chunks with no lexicon match — because low coverage weakens conclusions.

LIBRARIES: NLTK 3.10.3 — vader SentimentIntensityAnalyzer NLTK 3.10.3 — punkt sentence tokenizer

English: VADER compound scores (Hutto & Gilbert 2014), a published and externally validated instrument, scored per sentence and averaged at the chunk level; other languages: lexicon matching with negation-window adjustment, validated against an internal Indonesian gold set, with per-run lexicon coverage statistics.

2.4. Co-occurrence Analysis

Map word associations using a sliding window and calculate NPMI (Normalized PMI) for word pairs.

2.4.1. METHOD & IMPLEMENTATION

Sliding-window co-occurrence ranked by NPMI

1. A configurable sliding window (default: 5 tokens) scans each chunk and records which token pairs appear in proximity.
2. Pair counts are converted to NPMI scores from -1 (never together) to +1 (always together), normalizing for how common each word is on its own.
3. The strongest associations form a heatmap matrix revealing conceptual relationships between words.

LIBRARIES: Python 3.12 — `stdlib collections.Counter` + pure-Python NPMI math

Sliding-window co-occurrence ranked by NPMI (Bouma 2009).
